Field of the Invention The present invention relates to a method for manufacturing a semiconductor device, and more particularly, to a method for manufacturing a semiconductor device which can improve a contact resistance. 2. Description of the Prior Art As semiconductor devices become more highly integrated, the area of contact between the source/drain and the substrate becomes smaller. Consequently, the distance between the two areas becomes closer. A shallow junction is thus used as a contact structure. Thus, a contact resistance between the source/drain and the substrate can be reduced. However, a leak current increases with the reduction of the distance between the source/drain and the substrate. In order to improve this, a salicide technology has been used. According to this technology, a titanium silicide ($TiSi_2$) is formed on the source/drain to decrease the resistance of the source/drain. At this time, the $TiSi_2$ is formed by reaction between a titanium layer and a silicide layer formed on the source/drain.
