Photoshop Elements, formerly Photoshop Lightroom, is a multimedia editing program that works with digital images and supports a wide variety of graphics file formats. It is designed to be more intuitive and easier to use than Photoshop. Another industry standard for creating, editing, and modifying graphics is Adobe Illustrator. It comes with Adobe Photoshop, but it's also on its own. Adobe Illustrator enables you to create, manipulate, and manage vector graphics from scratch. Vector graphics use mathematical formulas to specify coordinates in two-dimensional space, creating shapes that are inherently scalable, meaning they can be adjusted simply by scaling them. Illustrator offers a modular workspace that supports the tools needed for editing. You can create documents, draw shapes, and paint. You can also work with AutoCAD-style blocks to arrange and manipulate shapes, and modify them at any time. For more information on Adobe Photoshop and Adobe Illustrator, visit `www.adobe.com`. Photoshop Express If Photoshop is too complicated, Photoshop Express can do almost everything Photoshop can do. Photoshop Express includes several tools that enable you to modify images in a manner similar to a photo editing application. These include Spot Healing, Blend, Gradient Generator, Posterize, Color Adjust, Clone Sticker, and Preset Manager, which enables you to create and store a range of settings. The entire program is free and available for use on a variety of platforms, including Windows, Mac, iPad, iPhone, Android, and Web browsers. It's designed to make image editing simple. Because Photoshop is so heavily ingrained in the industry, most people know it can do the basic things. Photoshop Express is designed to be the ultimate consumer application. You can find more details on Photoshop Express at `www.adobe.com`. Photomerge One of the most popular features of Photoshop is Photomerge. A powerful tool for creating panoramic images, Photomerge includes the Merge to HDR Pro, which can create a single exposure from up to 10 different images. It supports HDR (.hdr) and OpenEXR (.exr) image formats, and enables you to create HDR images and Auto-Stitch images. For more on using Photomerge, go to `www.adobe.com`. Moire and Motion Blur Some modern digital cameras feature software that can reduce moire or interference in the original image caused by the horizontal and vertical lines of

Q: How can I create a new class from a.zip file in python? I have a.zip file containing a directory of.class files. I have a directory with the same name as the.zip file, so I am presuming that my zip file contains all of the class files in that directory. How do I go about reading through the.zip file, finding the class files and creating a new class from them, in python? A: You can use zipfile to get the list of filenames in the zipfile. import zipfile zf = zipfile.ZipFile('test.zip') names = zf.namelist() zf.extractall('.') Now read all files and create a class from each file from itertools import izip for src, dest in izip(names, zf.namelist()): classname = src.replace('.class', '') import sys sys.path.insert(0, dest) class classobj(type): def __init__(self, obj): self.__dict__.update(obj.__dict__) def __repr__(self): return repr(self.__dict__) classobj(dest + '.class',) # dest contains classname The following description is presented to aid in the understanding of the present invention, but is not admitted to be prior art to the present invention. Cellular signal transduction is a method by which extracellular stimuli such as growth factors, cytokines, lipid-derived factors, and hormones exert their effects on cellular physiology. Cellular signal transduction involves a two-component system. One component of the two-component system is a regulatory protein while the second component is a protein that is acted upon by the regulatory protein. The regulatory protein is commonly referred to as a receptor. Receptors, such as interleukin-2 (IL-2) receptors, are membrane proteins located on the surface of cells. The ligand-binding region of the receptor has several membrane-distal regions, one of which

Layer Masks can be used to hide specific areas of a layer. You can use them to mask areas of an image for post-processing or to fix mistakes. The Pen tool is great for creating various line effects. You can use the Brush tool to draw paths. You can use transformations to rotate, move, flip and distort an image. The Brush tool can be used to paint the background of an image or to add a photo effect. Once you feel comfortable with the tools, start experimenting! You can always use the Help menu to learn more about a certain tool or step through tutorials. Step 1: Create a Background for Your Photo A good way to get started is to create a simple background to your photo. 1) Create a new image and choose 80% as the size. 2) Go to the Layers panel and select the Background layer. 3) With the Brush tool, paint a gray background on the image. 4) Set the Brush size to 8 pixels. 5) Click once at the top-left corner and drag the brush down and to the right until the background is covered. 6) Click the border of the image to crop. 7) Save your image. Step 2: Find and Add the Photo Now that you have created the background, you can add the photo to the top. 1) Go to the Layers panel and select Layer 1. 2) Rename it to "Photo" and double-click it to open it. 3) In the Photo layer, click anywhere in the middle of the image and drag it to the top of the canvas to place it on top of the gray background. 4) Now, go to the Photo layer's drop-down menu and choose Flip Horizontal. This will flip the image horizontally. 5) Save your image. Step 3: Add Your Photo in a Frame The next step is to add a frame around your photo. 1) With the Pick Tool, drag it to the left of the photo. 2) Scale the image to 3 pixels on the right and 6 pixels on the bottom. 3) Create a new layer and choose Round Corners in the Effects panel. 4) Add a layer mask to the layer to cover the rest of the canvas. Step 4: Add an Eye The next step is to add an eye to the center of the frame.
